Pin summary

A20M#	1	Address bit 20 Mask is an emulator signal.
A31A3	10	Address, in combination with byte enable, indicate the
		physical addresses of memory or device that is the target
		of a bus transaction. This signal is an output, when the
	}	processor is initiating the bus transaction, and an input
	1	when the processor is receiving an inquire transaction or
		snooping another processor's bus transaction.
ADS#	10	ADdress Strobe, when asserted, indicates new bus
		transaction by the processor, with valid address and byte
		enable simultaneously driven.
ADSC#	0	Address Strobe Copy is driven identically to address
		strobe
AHOLD	1	Address HOLD, when asserted, causes the processor to
		cease driving address and address parity in the next bus
	ļ.,,,,	clock cycle.
AP	10	Address Parity contains even parity on the same cycle as
	İ	address. Address parity is generated by the processor
		when address is an output, and is checked when address
		is an input. A parity error causes a bus error machine
	<u> </u>	check.
APCHK#	0	Address Parity CHecK is asserted two bus clocks after
	ļ	EADS# if address parity is not even parity of address.
APICEN		Advanced Programmable Interrupt Controller ENable
	1	is not implemented.
BE7#BE0#	10	Byte Enable indicates which bytes are the subject of a
		read or write transaction and are driven on the same cycle
55/ 550	ļ	as address.
BF1BF0		Bus Frequency is sampled to permit software to select
2055"	↓.	the ratio of the processor clock to the bus clock.
BOFF#	1	BackOFF is sampled on the rising edge of each bus clock,
	-	and when asserted, the processor floats bus signals on the
		next bus clock and aborts the current bus cycle, until the
DD0 DD0		backoff signal is sampled negated.
BP3BP0	0	BreakPoint is an emulator signal.
BRDY#		Bus ReaDY indicates that valid data is present on data on
		a read transaction, or that data has been accepted on a
DDDVO#	 	write transaction.
BRDYC#		Bus ReaDY Copy is identical to BRDY#; asserting either
	<u> </u>	signal has the same effect.
BREQ	10	Bus REQuest indicates a processor initiated bus request.

DUCOLUCE	—	DUO 011 17:
BUSCHK#		BUS CHeck is sampled on the rising edge of the bus
	-	clock, and when asserted, causes a bus error machine
04011511	 	check.
CACHE#	0	CACHE, when asserted, indicates a cacheable read
	J	transaction or a burst write transaction.
CLK	1	bus CLocK provides the bus clock timing edge and the
		frequency reference for the processor clock.
CPUTYP	11	CPU TYPe, if low indicates the primary processor, if high,
		the dual processor.
D/C#		Data/Code is driven with the address signal to indicate
		data, code, or special cycles.
D63D0	10	Data communicates 64 bits of data per bus clock.
D/P#	0	Dual/Primary is driven (asserted, low) with address on
		the primary processor
DP7DP0	10	Data Parity contains even parity on the same cycle as
		data. A parity error causes a bus error machine check.
DPEN#	10	Dual Processing Enable is asserted (driven low) by a
·		Dual processor at reset and sampled by a Primary
	l	processor at the falling edge of reset.
EADS#	T	External Address Strobe indicates that an external
		device has driven address for an inquire cycle.
EWBE#	1	External Write Buffer Empty indicates that the external
		system has no pending write.
FERR#	0	Floating point ERRor is an emulator signal.
FLUSH#		cache FLUSH is an emulator signal.
FRCMC#	I	Functional Redundancy Checking Master/Checker is
		not implemented.
HIT#	10	HIT indicates that an inquire cycle or cache snoop hits a
		valid line.
HITM#	10	HIT to a Modfied line indicates that an inquire cycle or
		cache snoop hits a sub-block in the M cache state.
HLDA	0	bus HoLD Acknowlege is asserted (driven high) to
		acknowlege a bus hold request
HOLD	1	bus HOLD request causes the processor to float most of
		its pins and assert bus hold acknowlege after completing
		all outstanding bus transactions, or during reset.
IERR#	0	Internal ERRor is an emulator signal.
IGNNE#	Ī	IGNore Numeric Error is an emulator signal.
INIT	ī	INITialization is an emulator signal.
INTR		maskable IN a Rrupt is an emulator signal.
INV		INValidation controls whether to invalidate the addressed
		cache sub-block on an inqure transaction.
		table of the strain of the strain action.

Fig. 48 (cont'd)

KEN#	TT	Cache ENable is driven with address to indicate that the
IXLINT	1'	read or write transaction is cacheable.
LINT1LINTO	1,-	Local INTerrupt is not implemented.
LOCK#	6	bus LOCK is driven starting with address and ending
LOOK		after bus ready to indicate a locked series of bus
	1	transactions.
M/IO#	0	
101/10#		Memory/Input Output is driven with address to indicate a
NA#	+	memory or I/O transaction.
IVA#		Next Address indicates that the external system will
NINA)	1	accept an address for a new bus cycle in two bus clocks.
NMI DDCNT#	110	Non Maskable Interrupt is an emulator signal.
PBGNT#	10	The state of the s
		processors to indicate that bus arbitration has completed,
DDD50#	ļ.,	granting a new master access to the bus.
PBREQ#	10	Private Bus REQuest is driven between Primary and Dual.
	_	processors to request a new master access to the bus.
PCD	0	Page Cache Disable is driven with address to indicate a
		not cacheable transaction.
PCHK#	0	Parity CHecK is asserted (driven low) two bus clocks after
		data appears with odd parity on enabled bytes.
PHIT#	10	Private HIT is driven between Primary and Dual
		processors to indicate that the current read or write
	İ	transaction addresses a valid cache sub-block in the slave
		processor.
PHITM#	10	Private HIT Modified is driven between Primary and Dual
		processors to indicate that the current read or write
		transaction addresses a modified cache sub-block in the
		slave processor.
PICCLK	1	Programmable Interrupt Controller CLocK is not
		implemented.
PICD1PICD	10	Programmable Interrupt Controller Data is not
0		implemented.
PEN#	ı	Parity Enable, if active on the data cycle, allows a parity
		error to cause a bus error machine check.
PM1PM0	0	Performance Monitoring is an emulator signal.
PRDY	0	Probe ReaDY is not implemented.
PWT	0	Page Write Through is driven with address to indicate a
		not write allocate transaction.
R/S#		Run/Stop is not implemented.
RESET	1	RESET causes a processor reset.
SCYC	0	Split CYCle is asserted during bus lock to indicate that
,		more than two transactions are in the series of bus
		transactions.

Fig. 48 (cont'd)

SMI#		System Manag ment Interrupt is an emulator signal.
SMIACT#	0	System Management Interrupt ACTive is an emulator
		signal.
STPCLK#		SToP CLocK is an emulator signal.
TCK		Test CLocK follows IEEE 1149.1.
TDI		Test Data Input follows IEEE 1149.1.
TDO	0	Test Data Output follows IEEE 1149.1.
TMS	1	Test Mode Select follows IEEE 1149.1.
TRST#		Test ReSeT follows IEEE 1149.1.
VCC2	1	VCC of 2.8V at 25 pins
VCC3		VCC of 3.3V at 28 pins
VCC2DET#	0	VCC2 DETect sets appropriate VCC2 voltage level.
VSS	1	VSS supplied at 53 pins
W/R#	0	Write/Read is driven with address to indicate write vs.
		read transaction.
WB/WT#		Write Back/Write Through is returned to indicate that
	İ	data is permitted to be cached as write back.
